

Claims 1-9 are cancelled.

10. (new) A compression unit for a frame receiving compressible units for pipe penetration and/or cable entry in addition to the compression unit and which compression unit is to abut against two inner corners or walls of the frame, wherein supplemental parts are furnished for optional placement between the compression unit and the frame to adapt the form of the compression unit to the form of the frame.

11. (new) The compression unit of claim 10, wherein the surfaces of the compression unit facing inner corners or walls of the frame have a rounded form and each supplement part has a general L-shaped cross section, with a rounded surface and two straight sides.

12. (new) The compression unit of claim 11, wherein the rounded surface of the supplemental part is to abut against one of the rounded surfaces of the compression unit.

13. (new) The compression unit of claim 11, wherein the straight sides of the supplemental part is to abut against the surfaces of the frame forming a straight inner corner or that one of the straight sides of the supplemental part is to abut a wall of a frame.

14. (new) The compression unit of claim 10, wherein the compression unit comprises a first pair of wedges, a second pair of wedges and a screw, having both left-handed and right-handed threads, each thread co-operating with threads in sleeves in the first pair of wedges, whereby the

wedges of the of the first pair are in contact with the wedges of the second pair along inclined surfaces and the first pair of wedges may be removed by means of the screw towards and away from each other in the axial direction of the screw and the second pair of wedges is moved towards and away from each other in a perpendicular direction to the movement of the first pair and radially to the screw by means of the movement of the first pair of wedges.

15. (new) The compression unit of claim 14, wherein the wedges of the compression unit is made in one piece with straps separating the separate wedges.

16. (new) The compression unit of claim 15, wherein the supplemental parts are included in the component in one-piece.

17. (new) The compression unit of claim 16, wherein the supplemental parts are included in the component in one-piece in a way enabling tearing off of the supplemental parts.

18. (new) A method of adapting the form of a compression unit to the form of inner corners or walls of a frame for sealing receiving, in addition to the compression unit, further compressible units for pipe penetration and/or cable entry, wherein supplemental parts are placed on the compression unit if needed to adapt the compression unit to the form of the inner corner or the walls of the frame at which the compression unit is placed.
